

Joining Likelihood Framework

Post-call candidate categorization for the TalentAgent AI screening pipeline

HIGH · **MEDIUM** · **LOW** · WITHDRAWN

What was requested

Neeraj's direction, in short

“

Score is not essential right now. Show me who is more probable and who is less probable — and why. If more likely, show the criteria that match. If less likely, specify the red flags where criteria did not meet.

1

No numeric score

Categorize into likelihood buckets, not a 0–100 number

2

Bucketed output

High / Medium / Low likely-to-join (+ Withdrawn)

3

Always show the reason

Matched criteria for high, red flags for low — every time

How it works — rules decide, not the LLM

Why this matters: the LLM never decides who passes — it only reads answers. Every decision is a fixed rule, so the result is the same every time and can be audited.

Four categories — and how each is decided

HIGH

Zero flags

All joining criteria met

MEDIUM

Exactly 1 soft flag

One resolvable risk

LOW

Any hard flag, or 2+ soft flags

Dealbreaker or multiple risks

WITHDRAWN

Candidate not interested

Self-withdrawal (kept separate)

Decision order

Any HARD flag?

→ **LOW**

else 2+ SOFT flags?

→ **LOW**

else 1 SOFT flag?

→ **MEDIUM**

else no flags

→ **HIGH**

The criteria — and what counts as a flag

HARD flags — dealbreaker, forces LOW

Location

Doesn't match primary location, role isn't remote, and candidate won't relocate

Work model

Not comfortable with the required work mode (e.g. wants WFH, role is hybrid)

SOFT flags — risk, counted toward tier

CTC

Expected pay over budget

Notice

Notice > limit and no buyout (N/A if unemployed)

BGC docs

Missing documents for background verification

Competing offers

Advanced-stage offer in hand — renege risk

Worked examples

HIGH

All 6 criteria met

- Location match · hybrid OK · CTC in budget
- 30-day notice · BGC ready · no other offers

MEDIUM

1 soft flag

- Notice 90 days with no buyout
- Everything else clears

LOW

1 hard + 1 soft flag

- Work model: wants WFH, role is hybrid (hard)
- CTC 22L over 18L budget, won't negotiate (soft)

WITHDRAWN

Self-withdrawal

- Said no longer interested in the role
- Other criteria not evaluated

Every candidate carries its reasons

Example: what shows when you open a LOW candidate

Matched criteria — why still possible

- ✓ Location: Pune match, no relocation needed
- ✓ Notice: 30 days, within the 60-day limit
- ✓ BGC: all documents ready
- ✓ Competing offers: none

Red flags — why less likely

Work model (HARD)

Not comfortable with hybrid — wants WFH

evidence: “main hybrid comfortable nahi hoon”

CTC (SOFT)

Expected 22L over 18L budget, won't negotiate

evidence: “itne pe move nahi karunga”

Summary: Low likelihood — dealbreaker: work_model | risk: ctc

Why this design holds up

1

Deterministic & auditable

Same input always gives the same result. No LLM randomness in the decision — every rejection is explainable and defensible.

2

Config-driven per JD

Notice limit, budget, location and work mode all come from per-role config. One engine handles every JD; nothing is hardcoded.

3

Explainable by default

Every candidate carries matched criteria, red flags, and the candidate's own words — not a black-box label.

Integration & next step

Ready to plug in

- Adds a joining_likelihood field to evaluation.json
- Pure function — (answers + JD config) in, category + reasons out
- No side effects; hands cleanly to Rahul / Tarun to wire into the pipeline

One decision for you

CTC over budget + refuses to negotiate is currently a **soft flag** → **Medium**. Should it instead be a dealbreaker → Low? It's a one-line change either way.

Deterministic · Config-driven · Explainable
